

# PROGRAMMING MULTI-GPU NODES

Steve Abbott, February 12, 2019

# AGENDA

Multi-GPU Programming Models

Multi-GPU Programming with OpenACC and CUDA

# SUMMIT NODE

(2) IBM POWER9 + (6) NVIDIA VOLTA V100

The background of the slide is a dark blue field with a network of thin, light green lines connecting various points. These points are represented by small, bright green circles of varying sizes, some of which have a soft glow. The lines and dots create a sense of a complex, interconnected system, possibly representing a network or data flow.

# **MULTI-GPU PROGRAMMING MODELS**

# MULTI-GPU PROGRAMMING MODELS

## Single Thread, Multiple GPUs

- A single thread will change devices as-needed to send data and kernels to different GPUs

## Multiple Threads, Multiple GPUs

- Using OpenMP, Pthreads, or similar, each thread can manage its own GPU

## Multiple Ranks, Single GPU

- Each rank acts as-if there's just 1 GPU, but multiple ranks per node use all GPUs

## Multiple Ranks, Multiple GPUs

- Each rank manages multiple GPUs, multiple ranks/node. Gets complicated quickly!

# MULTI-GPU PROGRAMMING MODELS

## Trade-offs Between Approaches

- Conceptually Simple
- Requires additional loops
- CPU can become a bottleneck
- Remaining CPU cores often underutilized

Single Thread, Multiple GPUs

- Conceptually Very Simple
- Set and forget the device numbers
- Relies on external Threading API
- Can see improved utilization
- Watch affinity

Multiple Threads, Multiple GPUs

- Little to no code changes required
- Re-uses existing domain decomposition
- Probably already using MPI
- Watch affinity

Multiple Ranks, Single GPU

- Easily share data between peer devices
- Coordinating between GPUs extremely tricky

Multiple Ranks, Multiple GPUs

# MULTI-DEVICE CUDA

CUDA by default exposes all devices, numbered 0 - (N-1), if devices are not all the same, it will reorder the “best” to device 0.

Each device has its own pool of streams.

If you do nothing, *all* work will go to Device #0.

Developer must change the current device explicitly

# MULTI-DEVICE OPENACC

OpenACC presents devices numbered 0 - (N-1) for each device type available.

The order of the devices comes from the runtime, almost certainly the same as CUDA

By default all data and work go to the *current device*

Developers must change the current device and maybe the current device type using an API

# MULTI-DEVICE OPENMP

OpenMP devices numbered 0 - (N-1) for *ALL* devices on the machine, including the host.

The order is determined by the runtime, but devices of the same type are contiguous.

To change the device for data and compute a clause is added to directives.

Device API routines include a devicenum

The background of the slide features an abstract network diagram. It consists of numerous small, bright green circular nodes scattered across a dark, almost black, background. These nodes are interconnected by a dense web of thin, light green lines, creating a complex, web-like structure that suggests a network or data flow. The lines vary in length and orientation, some connecting nearby nodes while others span larger distances. The overall effect is a high-tech, digital aesthetic.

# **MULTI-GPU PROGRAMMING WITH OPENACC AND CUDA**

# MULTI-GPU W/ CUDA AND OPENACC

The CUDA and OpenACC approaches are sufficiently similar, that I will demonstrate using OpenACC.

Decoder Ring:

OpenACC	CUDA
acc_get_device_type()	N/A
acc_set_device_type()	N/A
acc_set_device_num()	cudaSetDevice()
acc_get_device_num()	cudaGetDevice()
acc_get_num_devices()	cudaGetDeviceCount()

# Multi-Device Pipeline

## A Case Study

We'll use a simple image filter to demonstrate these techniques.

No inter-GPU communication required

Pipelining: Breaking a large operation into smaller parts so that independent operations can overlap.

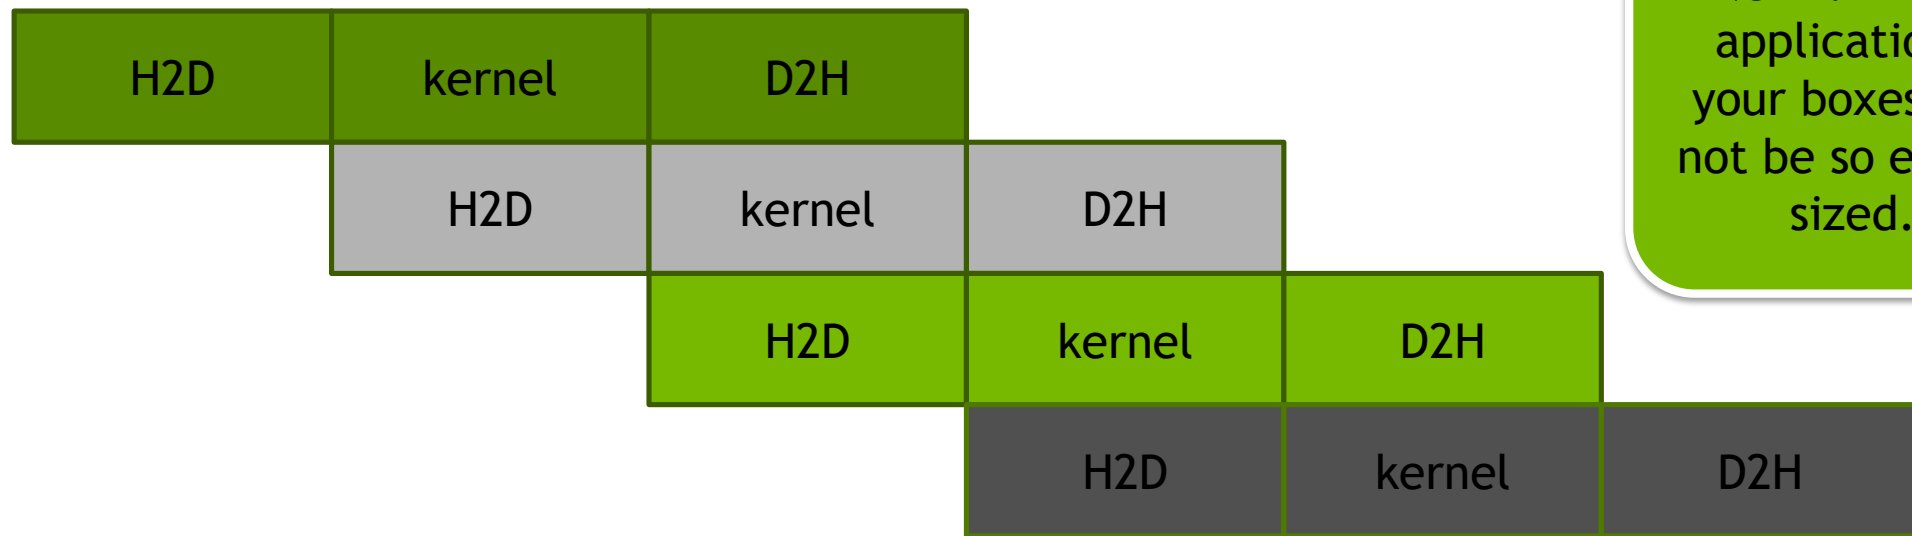

Since each part is independent, they can easily be run on different devices. We will extend the filter to run on more than one device.

# Pipelining in a Nutshell

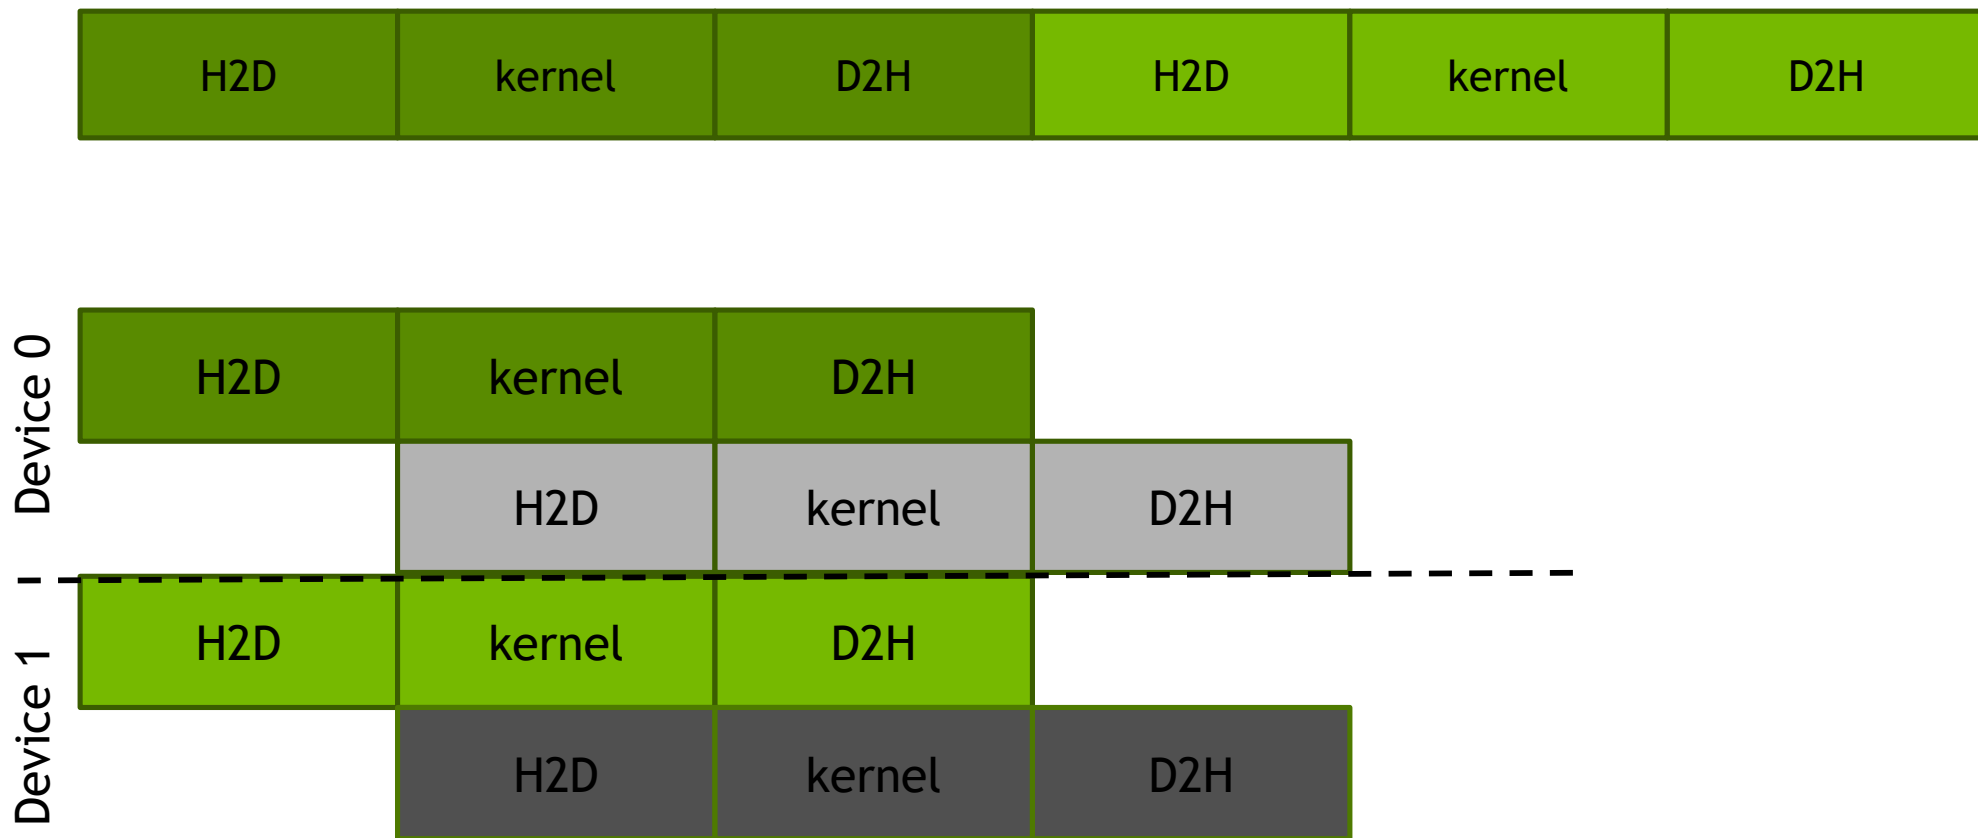

Two Independent Operations Serialized

Overlapping Copying and Computation

NOTE: In real applications, your boxes will not be so evenly sized.

# Multi-device Pipelining in a Nutshell

# Pipelined Code

```
#pragma acc data create(imgData[w*h*ch],out[w*h*ch])
    copyin(filter)
{
for ( long blocky = 0; blocky < nblocks; blocky++)
{
    long starty = MAX(0,blocky * blocksize - filtersize/2);
    long endy    = MIN(h,starty + blocksize + filtersize/2);
#pragma acc update device(imgData[starty*step:blocksize*step]) async(block%3)
    starty = blocky * blocksize;
    endy = starty + blocksize;
#pragma acc parallel loop collapse(2) gang vector async(block%3)
    for (y=starty; y<endy; y++) for ( x=0; x<w; x++ ) {
        <filter code omitted>
        out[y * step + x * ch]      = 255 - (scale * blue);
        out[y * step + x * ch + 1 ] = 255 - (scale * green);
        out[y * step + x * ch + 2 ] = 255 - (scale * red);
    }
#pragma acc update self(out[starty*step:blocksize*step]) async(block%3)
}
#pragma acc wait
}
```

Cycle between 3 async  
queues by blocks.

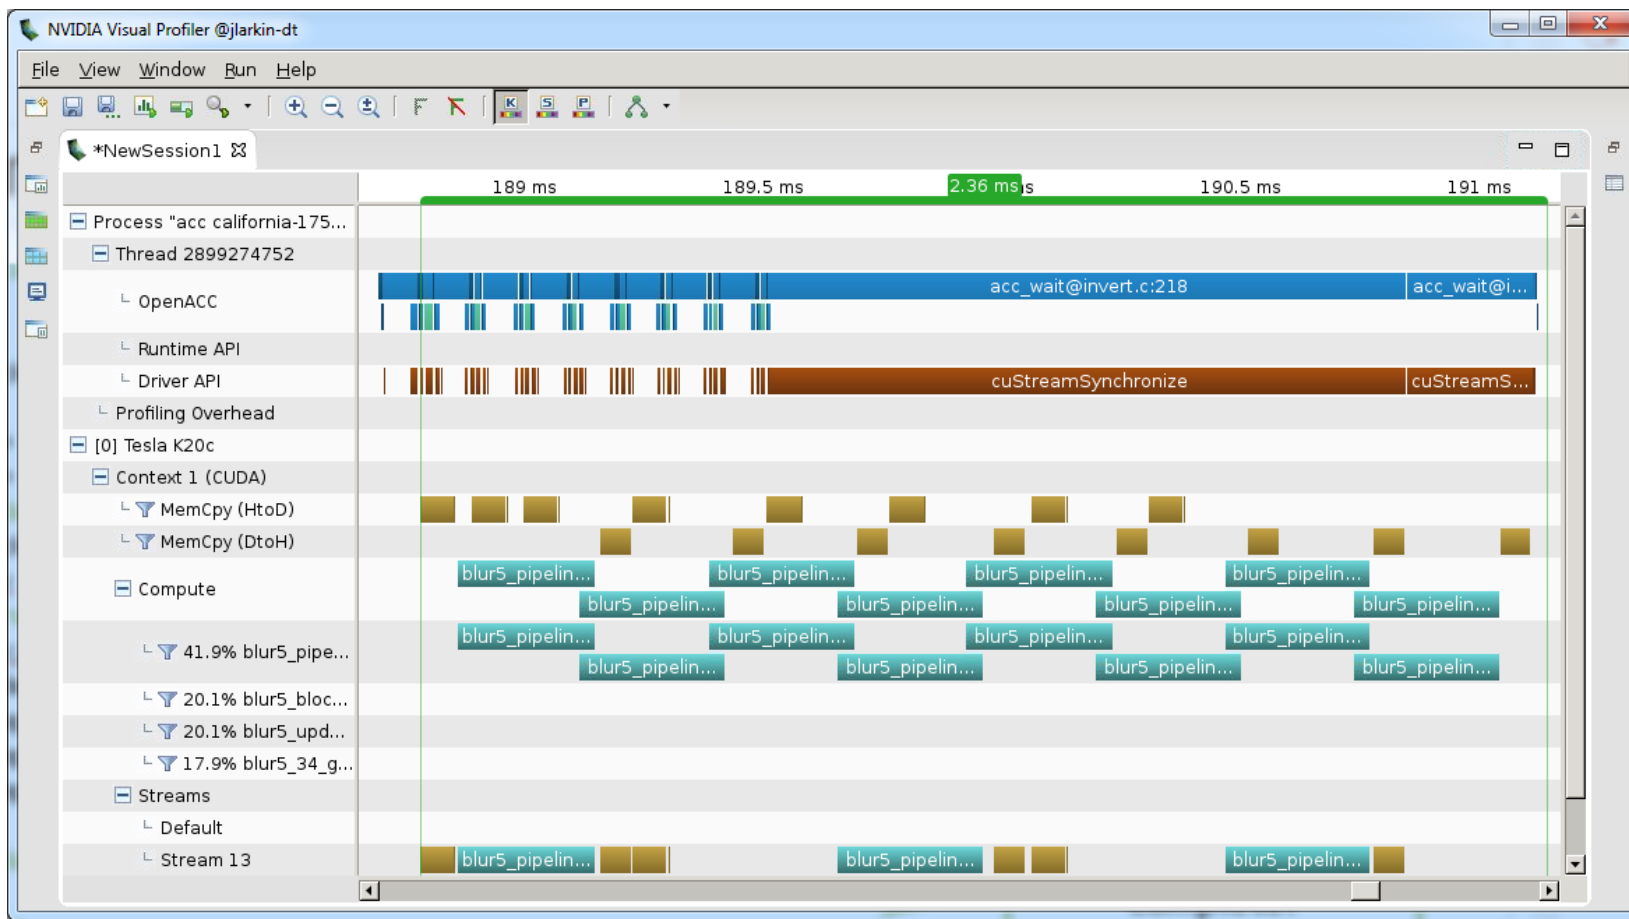

# Pipelined Code

```
#pragma acc data create(imgData[w*h*ch],out[w*h*ch])
    copyin(filter)
{
for ( long blocky = 0; blocky < nblocks; blocky++)
{
    long starty = MAX(0,blocky * blocksize - filtersize/2);
    long endy    = MIN(h,starty + blocksize + filtersize/2);
#pragma acc update device(imgData[starty*step:blocksize*step]) async(block%3)
    starty = blocky * blocksize;
    endy = starty + blocksize;
#pragma acc parallel loop collapse(2) gang vector async(block%3)
    for (y=starty; y<endy; y++) for ( x=0; x<w; x++ ) {
        <filter code omitted>
        out[y * step + x * ch]      = 255 - (scale * blue);
        out[y * step + x * ch + 1 ] = 255 - (scale * green);
        out[y * step + x * ch + 2 ] = 255 - (scale * red);
    }
#pragma acc update self(out[starty*step:blocksize*step]) async(block%3)
}
#pragma acc wait
}
```

Cycle between 3 async queues by blocks.

Wait for all blocks to complete.

# NVPROF Timeline of Pipeline

# Extending to multiple devices

Create 1 OpenMP thread on the CPU per-device. This is not strictly necessary, but simplifies the code.

Within each thread, set the device number.

Divide the blocks as evenly as possible among the CPU threads.

# Multi-GPU Pipelined Code (OpenMP)

```
#pragma omp parallel num_threads(acc_get_num_devices(acc_device_default))
{
    acc_set_device_num(omp_get_thread_num(),acc_device_default);
    int queue = 1;
    #pragma acc data create(imgData[w*h*ch],out[w*h*ch])
    {
        #pragma omp for schedule(static)
        for ( long blocky = 0; blocky < nblocks; blocky++) {
            // For data copies we need to include the ghost zones for the filter
            long starty = MAX(0,blocky * blocksize - filtersize/2);
            long endy    = MIN(h,starty + blocksize + filtersize/2);
            #pragma acc update device(imgData[starty*step:(endy-starty)*step]) async(queue)
            starty = blocky * blocksize;
            endy = starty + blocksize;
            #pragma acc parallel loop collapse(2) gang vector async(queue)
            for ( long y = starty; y < endy; y++ ) { for ( long x = 0; x < w; x++ ) {
                <filter code removed for space>
            }}
            #pragma acc update self(out[starty*step:blocksize*step]) async(queue)
            queue = (queue%3)+1;
        }
        #pragma acc wait
    }
}
```

Spawn 1 thread per device.

Set the device number per-thread.

Divide the work among threads.

Wait for each device in its thread.

# Multi-GPU Pipelined Performance

# OpenACC with MPI

Domain decomposition is performed using MPI ranks

Each rank should set its own device

- Maybe `acc_set_device_num`
- Maybe handled by environment variable (`CUDA_VISIBLE_DEVICES`)

GPU affinity can be handled by standard MPI task placement

Multiple MPI Ranks/GPU (using MPS) can work in place of OpenACC work queues/CUDA Streams

# Setting a device by local rank

```
// This is not portable to other MPI libraries
char *comm_local_rank = getenv("OMPI_COMM_WORLD_LOCAL_RANK");
int local_rank = atoi(comm_local_rank);
char *comm_local_size = getenv("OMPI_COMM_WORLD_LOCAL_SIZE");
int local_size = atoi(comm_local_size);
int num_devices = acc_get_num_devices(acc_device_nvidia);
#pragma acc set device_num(local_rank%num_devices) \
               device_type(acc_device_nvidia)
```

Determine a unique ID  
for each rank on the  
same node.

Use this unique ID to  
select a device per  
rank.

You may also try using `MPI_Comm_split_type()` using `MPI_COMM_TYPE_SHARED` or `OMPI_COMM_TYPE_SOCKET`.

In the end, you need to understand how `jsrun/mpirun` is placing your ranks.

# MPI Image Filter (pseudocode)

```
if (rank == 0 ) read_image();  
// Distribute the image to all ranks  
MPI_Scatterv(image);
```

Decompose image  
across processes  
(ranks)

```
MPI_Barrier(); // Ensures all ranks line up for timing  
omp_get_wtime();  
blur_filter(); // Contains OpenACC filter  
MPI_Barrier(); // Ensures all ranks complete before timing  
omp_get_wtime();
```

Receive final parts  
from all ranks.

```
MPI_Gatherv(out);  
if (rank == 0 ) write_image();  
  
$ jsrun -n 6 -a 1 -c 1 -g 1 ...
```

Launch with good  
GPU/process affinity

There's a variety of ways to do MPI decomposition, this is what I used for this particular example.

# Multi-GPU Pipelined Performance (MPI)

# Multi-GPU Pipelined Performance (MPI)

# MULTI-DEVICE CUDA

## Same Pattern, Different API

```
#pragma omp parallel
{
    cudaSetDevice(idx);
    #pragma omp for
    for ( int b=0; b < nblocks; b++)
    {
        cudaMemcpyAsync(..., streams[b%3]);
        blur_kernel <<<griddim, blockdim,
                        0, streams[b%3]>>>();
        cudaMemcpyAsync(..., streams[b%3]);
    }

    cudaDeviceSynchronize();
}
```

```
MPI_Comm_rank(local_comm, &local_rank);

cudaSetDevice(local_rank);

for ( int b=0; b < nblocks; b++)
{
    cudaMemcpyAsync(..., streams[b%3]);
    blur_kernel <<<griddim, blockdim,
                0, streams[b%3]>>>();
    cudaMemcpyAsync(..., streams[b%3]);
}

cudaDeviceSynchronize();
```

# MULTI-DEVICE OPENMP 4.5

## Same Pattern, Different API

```
#pragma omp parallel num_threads(num_dev)
{
    #pragma omp for
    for ( int b=0; b < nblocks; b++)
    {
        #pragma omp target update map(to:...) \
            device(dev) depend(inout:A) \
            nowait
        #pragma omp target teams distribute \
            parallel for simd device(dev) \
            depend(inout:A)
        for(...) { ... }
        #pragma omp target update map(from:...) \
            device(dev) depend(inout:A) \
            nowait
    }
    #pragma omp taskwait
}
```

```
MPI_Comm_rank(local_comm, &local_rank);
int dev = local_rank;

for ( int b=0; b < nblocks; b++)
{
    #pragma omp target update map(to:...) \
        device(dev) depend(inout:A) \
        nowait
    #pragma omp target teams distribute \
        parallel for simd device(dev) \
        depend(inout:A)
    for(...) { ... }
    #pragma omp target update map(from:...) \
        device(dev) depend(inout:A) \
        nowait
}
#pragma omp taskwait
```

# Multi-GPU Approaches

## Choosing an approach

**Single-Threaded, Multiple-GPUs** - Requires additional loops to manage devices, likely undesirable.

**Multi-Threaded, Multiple-GPUs** - Very convenient set-and-forget the device. Could possibly conflict with existing threading.

**Multiple-Ranks, Single-GPU each** - Probably the simplest if you already have MPI, the decomposition is done. Must get your MPI placement correct

**Multiple-Ranks, Multiple-GPUs** - Can allow all GPUs to share common data structures. Only do this if you absolutely need to, difficult to get right.

The background features a dark blue field with a network of thin, light green lines connecting various points. These points are represented by small, glowing green dots of varying sizes. The lines and dots create a sense of a complex, interconnected system or network, possibly representing data flow or a global communication network. The overall aesthetic is futuristic and technological.

# CLOSING SUMMARY

# MULTI-GPU APPROACHES

## Choosing an approach

**Single-Threaded, Multiple-GPUs** - Requires additional loops to manage devices, likely undesirable.

**Multi-Threaded, Multiple-GPUs** - Very convenient set-and-forget the device. Could possibly conflict with existing threading.

**Multiple-Ranks, Single-GPU each** - Probably the simplest if you already have MPI, the decomposition is done. Must get your MPI placement correct

**Multiple-Ranks, Multiple-GPUs** - Can allow all GPUs to share common data structures. Only do this if you absolutely need to, difficult to get right.

# GPU TO GPU COMMUNICATION

- ▶ CUDA aware MPI functionally portable
  - ▶ OpenACC/MP interoperable
  - ▶ Performance may vary between on/off node, socket, HW support for GPU Direct
  - ▶ WARNING: Unified memory support varies wildly between implementations!
- ▶ Single-process, multi-GPU
  - ▶ Enable peer access for straight forward on-node transfers
- ▶ Multi-process, single-gpu
  - ▶ Pass CUDA IPC handles for on-node copies
- ▶ Combine for more flexibility/complexity!

# ESSENTIAL TOOLS AND TRICK

- ▶ Pick on-node layout with OLCF jsrun visualizer
  - ▶ <https://jsrunvisualizer.olcf.ornl.gov/index.html>
- ▶ Select MPI/GPU interaction with `jsrun --smpiargs`
  - ▶ “-gpu” for CUDA aware, “off” for pure GPU without MPI
- ▶ Profile MPI and NVLinks with `nvprof`
- ▶ Good performance will require experimentation!
