

Michael's Tip Corner

- Conda is **NOT** limited to the version of Python in the base environment
 - It's just a package manager that just happens to have Python installed

```
$ module load miniforge3  
$ python3 --version  
Python 3.10.13
```

```
$ conda create -y -n tip_corner python=3.11 && source activate tip_corner  
.  
.  
(tip_corner)$ python3 --version  
Python 3.11.11
```

```
$ source deactivate && conda create -y -n tip_corner_rebel python=2 && source activate tip_corner_rebel  
.  
.  
(tip_corner_rebel)$ python --version  
Python 2.7.15
```
